CC The invention relates to human G-protein coupled receptors, SNORF62 and CSNORF72 and their corresponding cDNA molecules. SNORF62 and sNORF72 CC receptors are specific for neuromedin U (NMU) neuropeptides, hence they CC are also known as NMU receptors. The agonist and antagonist of NMU corresponding to treating an abnormality in a subject that is alleviated by decreasing or increasing the activity of NMU receptor. CC The NMU receptors serves as a valuable tool for designing drugs which are useful for treating various pathophysiological conditions such as inflammation, arthritis, autoimmune diseases, transplant rejection, CC graft vs host disease, bacterial, fungal, protozoan and viral infections, cc septicaemia, AIDS, pain, psychotic and neurological disorders, including can anxiety, depression, schizophrenia, dementia, mental retardation, memory cc loss, epilepsy, neuromotor disorders, respiratory disorders, asthma, CC eating/body weight disorders including obesity, bulimia, diabetes, anorexia, nausea, hypertension, hypotension, vascular and cardiovascular cd disorders, renal disorders, bone diseases including osteoporosis, benign cc disorders, prenal disorders, such as psoriasis, allergies, Parkinson's cd disease, Alzheimer's disease, acute heart failure, angina disorders, delictium and dyskinesias such as psoriasis, epinephrine release cd disorders, electrolyte balance disorders, epinephrine release cd disorders, electrolyte balance disorders, endocrine disorders, memory alsorders metabalic disorders memory alsorders memory alsorders memory alsorders metabalic disorders memory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PR PR XXX

                                                                                                                                            The invention relates to human and rat neuromedin U receptor designated NMUR2 polypeptides and polypuclectides. NMUR2 also referred as FM-4, is free from associated proteins and is involved in the feeding behaviour in mammals. Sequences of the invention are useful for identifying compounds which modulate the feeding activity of a mammal. The compounds identified are useful for modulating eating and weight gain. The present
                                                                                                                                                                                                                                                                                                                                     New polypeptide, useful for identifying compounds feeding activity of a mammal, comprises the novel rat neuromedin U receptor designated NMUR2 -
                                                                                                                                                                                                                                                                                                                                                                                                                            P-PSDB; AAE14262

The NLR polynucleotide and protein can be used to isolate compounds that bind, (ant)agonise or alter the activity or expression of the NLR. The NLR is a G-protein coupled receptor which is expressed in the central nervous system and shares homology with human neurotensin receptor. The receptors can be used in

Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence encodes a splice variant of the long version of a human G-protein coupled receptor designated IGS4A. IGS4 exists in two polymorphic forms, IGS4 and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disorders,

```

The present sequence encodes a splice variant of the short version of human G-protein coupled receptor designated IGS4A. IGS4 exists in two polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4

hypertension), dyslipidemias, obesity, emesis, gastrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, altergies, sepsis or gynecological disorders. Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular disease, migraine, epilepsy, bulimia or stroke), cardiovascular disease.
overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (e.g.

                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length
(see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently
consists of 59 contigs. The true order of the pieces
is not known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as
runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                                         as soon as it is available and the accession number will be preserved.
